

species of lice are specific to flying squirrels.

Specimen F from Alberta, is included here because it was sent in as a whole animal, not merely as a skin,

and I was able to work it over myself. Its main interest is that it harboured Ferris' minute species *uncinatus* which seems widespread in more northern flying squirrels.

### LIST OF INSECTS AND MITES ATTACKING TREE FRUITS IN THE INTERIOR OF BRITISH COLUMBIA<sup>1</sup>

R. S. DOWNING<sup>2</sup>, C. V. G. MORGAN<sup>3</sup>, AND M. D. PROVERBS<sup>3</sup>

Entomology Laboratory, Summerland, B.C.

This is the first published list of insects and mites that attack tree fruits in the interior of British Columbia. It includes only the species that have

caused economic loss. Although some of them are but sporadically injurious, none are merely occasional or incidental feeders. An E in the host columns designates the pest as one of major economic importance against which control measures must be frequently taken; an S indicates that it is only sporadically injurious.
