#### ABSTRACT

Ten species of aphids and new host records are added to the taxonomic list of the aphids of British Columbia.

#### INTRODUCTION

The previous seven lists of the aphids of British Columbia (Forbes, Frazer and MacCarthy 1973; Forbes, Frazer and Chan 1974; Forbes and Chan 1976, 1978, 1980, 1981; Forbes, Chan and Footitt 1982) recorded 341 species of aphids collected from 708 different host plants. This comprises 1298 aphid-host plant associations.

The present list adds 10 aphid species (indicated with an asterisk in the list) and 78 aphid-host plant associations to the previous lists. Thirty-five of the new aphid-host plant associations are plant species not in the previous lists. The additions bring the number of known aphid species in British Columbia to 351. Aphids have now been collected from 743 different host plants and the total number of aphid-host plant associations is 1376.

The names of aphids are in conformity with Eastop and Hille Ris Lambers (1976) and are arranged alphabetically by species. The location of each collection site can be determined from the tables of localities in the previous papers.
