ABSTRACT

Six species of aphids and new host records are added to the taxonomic list of the aphids of British Columbia.

INTRODUCTION

Eight previous lists of the aphids of British Columbia (Forbes, Frazer and MacCarthy 1973; Forbes, Frazer and Chan 1974; Forbes and Chan 1976, 1978, 1980, 1981, 1983; Forbes, Chan and Foottit, 1982) record 351 species of aphids collected from 743 hosts or in traps and comprise 1376 aphid-host plant associations. The present list adds 6 aphid species (indicated with an asterisk in the list) and 107 aphid-host plant associations to the previous lists. Forty-two of the new aphid-host plant associations are plant species not in the previous

lists. The additions bring the number of known aphid species in British Columbia to 357. Aphids have now been collected from 785 different host plants and the total number of aphid-host plant associations is 1483.

The names of aphids are in conformity with Eastop and Hille Ris Lambers (1976) and are arranged alphabetically by species. Four new collection sites are tabulated in Table 1. The locations of each collection site can be determined from Table 1 or from the tables of localities in the previous papers. The reference points are the same as those shown on the map which accompanies the basic list.

TABLE 1. Collection sites of aphids, with airline distances from reference points.
